Testing

Nobody likes testing

- Boring
- Hard
- Feels like wasted time

Testing frameworks

Increasing number of tools, some multi-platform:

- Unit/integration testing: pgTAP, pgUnit, DbFit, DBUnit
- Configuration & unit testing: testgres
- Test coverage: piggly
- Penetration testing: SQLMap, Metasploit
- Performance testing: Apache Jmeter, Gatling

Test data – By hand

- Tedious – small data sets only

Test data – By code

- generate_series(), random()

- Consistency:
  - Referential integrity (FKs)
  - Explicit & implicit constraints
- What does “typical” data look like? (esp. text)

Test data – Existing data

- Generate subsets
  - Smaller for fast testing
  - Random
  - Consistent
  - Anonymized?
