Reduce Data Usage

Don't select too much data

```
SELECT first_name, last_name
FROM Person
```

… then application filters data.

```
SELECT first_name, last_name
FROM Person
WHERE city = 'Houston'
```

```
SELECT *
FROM Person
WHERE city = 'Houston'
```

… then application only uses name.

Don't update data with identical data

```
UPDATE Person
SET active = False
WHERE …          /* no recent bank activity */
      AND active = True
```

Avoids many writes to Person. Reduces any logging of writes.

Simplify complicated keys

Simplifies indices and joins on FKs.

Visit(v_id, doc_id, patient_id, …)
Test(t_id, v_id, doc_id, patient_id, …)

Visit(v_id, doc_id, patient_id, …)
Test(t_id, v_id, …)

Recall design with Visit & Test as weak entities.
