Course Summary

RECURRING THEMES

Methods for Finding Data

1.1	Linking in Hierarchical & Network data models
1.2	Pointers vs. Foreign keys
5.2	Relational DB indices
6.4	MongoDB indices
6.4	MongoDB design: standalone vs. embedded documents

Complex vs. Simple Design

2.6	ERD	vs.	Antipatterns
A4	Our design		Ancestry.com
4.2	Business logic in DB		In application
6.1	Inmon-style		Kimball-style data warehouse
6.2	Relational		OLAP, NoSQL

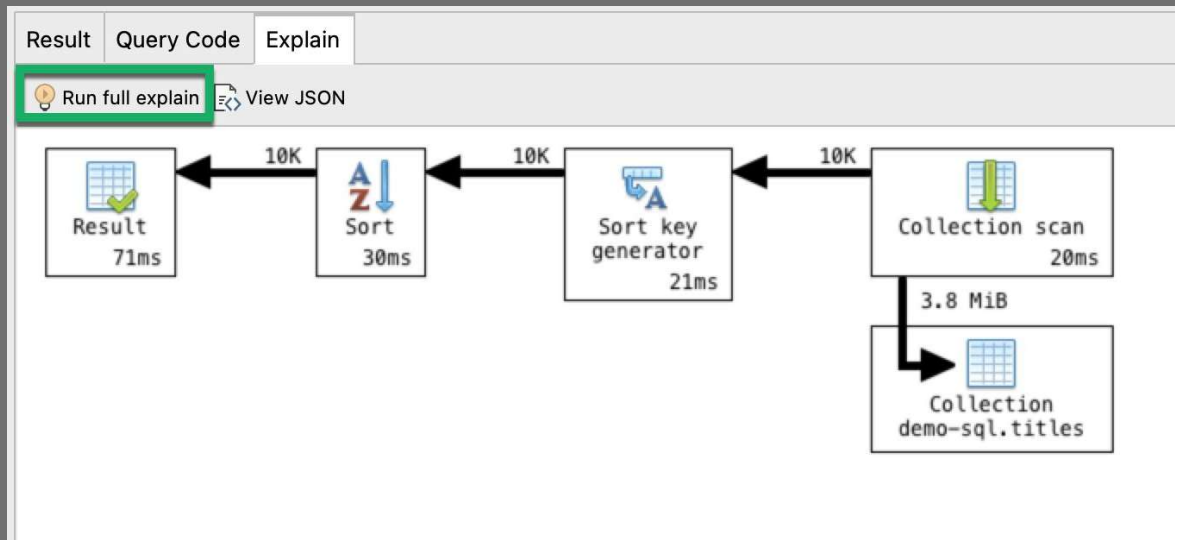

Data Integrity vs. Efficiency

A2	Our design	vs.	Ancestry.com
6.1	OLTP		OLAP
6.1	Normalize		Denormalize
6.2	ACID		BASE
6.4	ERD		Dimensional Modeling MongoDB Design

WHAT DID THIS COURSE COVER?

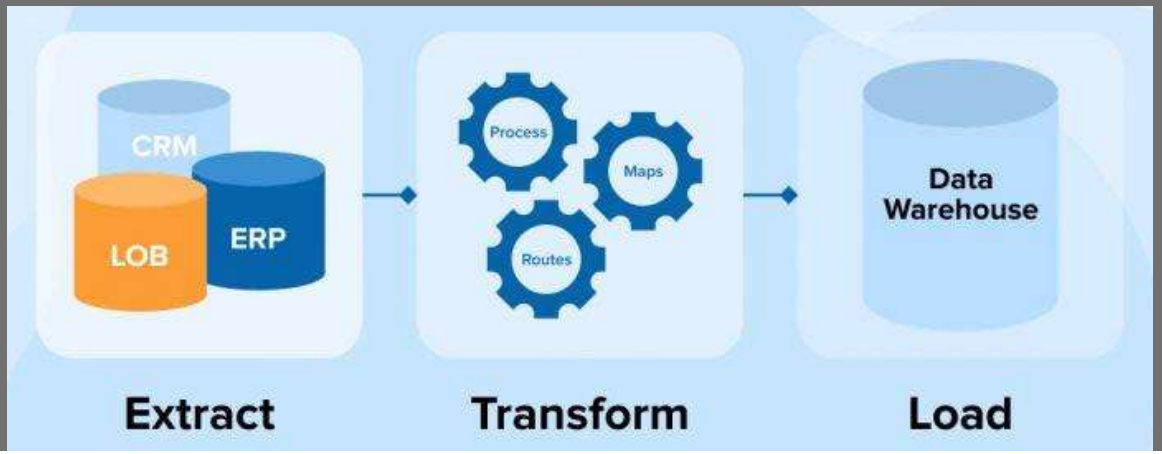

Database Theory

- Functions & relations
- Relational calculus & algebra
- Grouping
- Aggregation
- Query plans

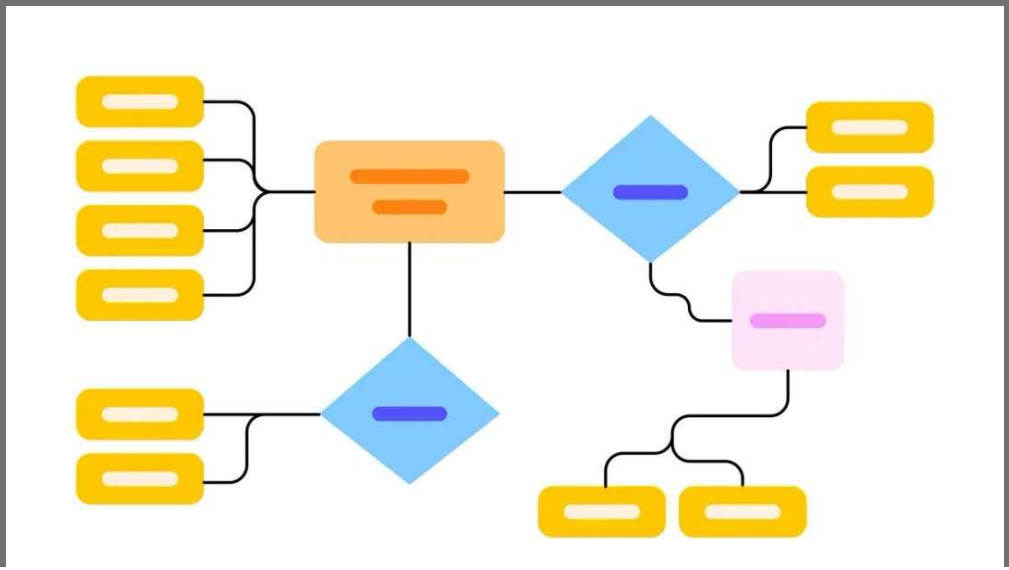

Database Programming

- SQL, PyMongo, Cypher
- Query costs & efficiency
- Database/application integration
- Security
- ETL

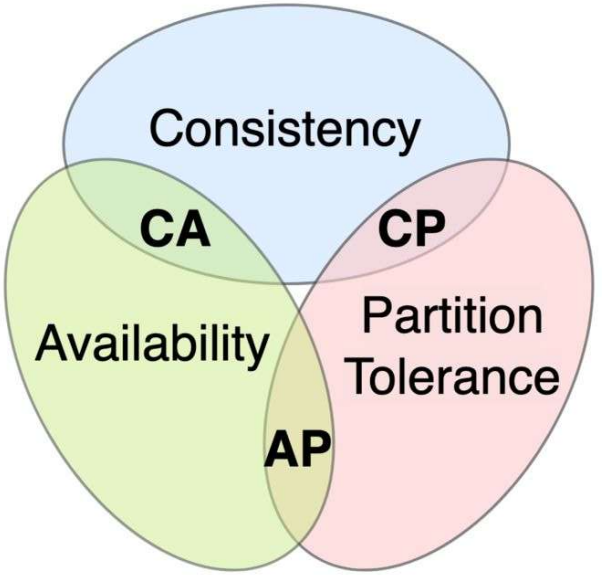

Database Design

- Design in OLTP, OLAP, MongoDB, Neo4J
- Normalization & denormalization

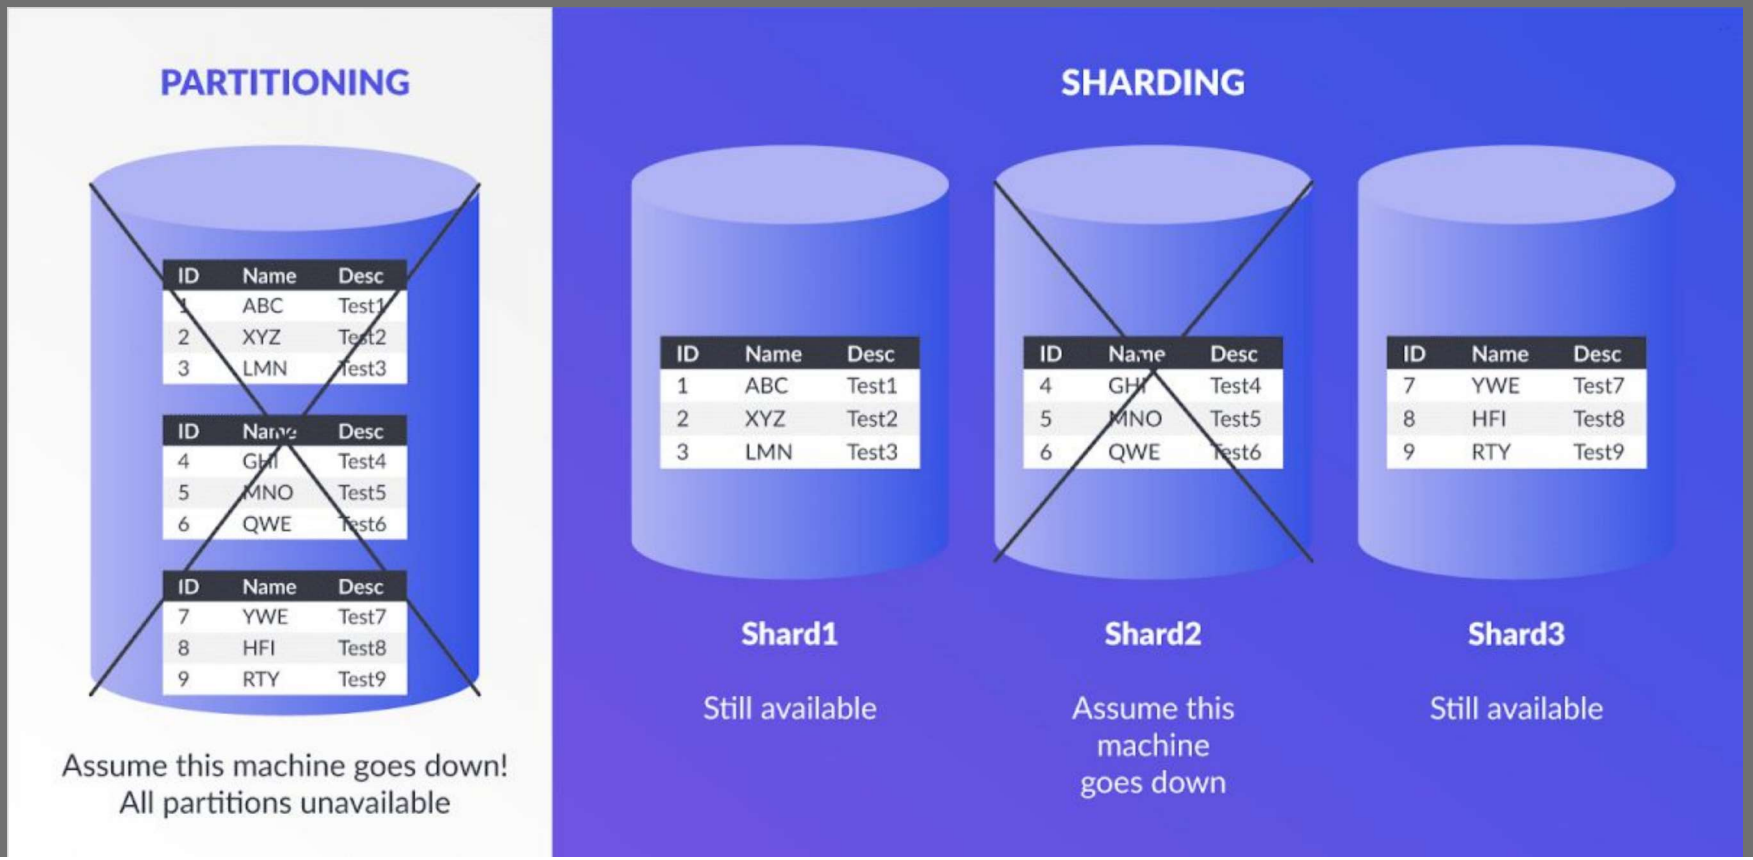

Concurrency in Databases

- Serialization
- Transactions & isolation levels
- ACID & BASE properties
- CAP theorem

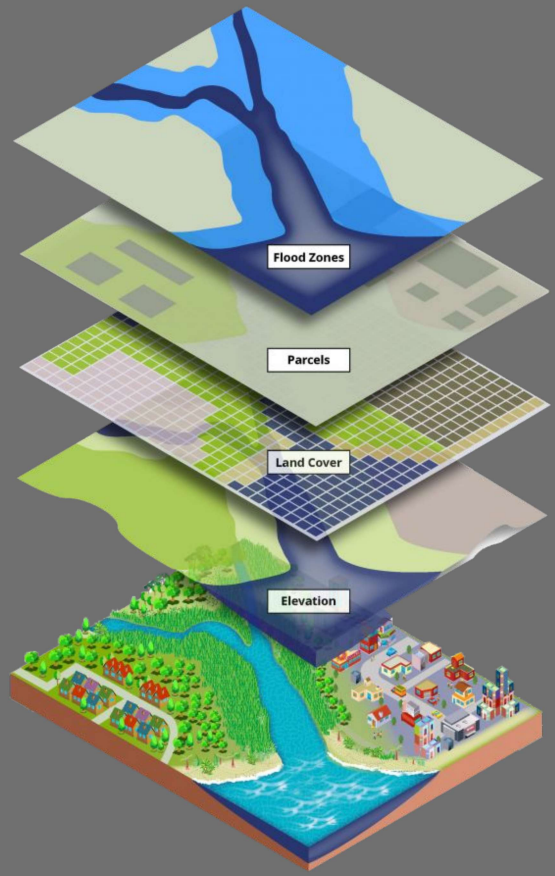

BEYOND THIS COURSE

Big Databases

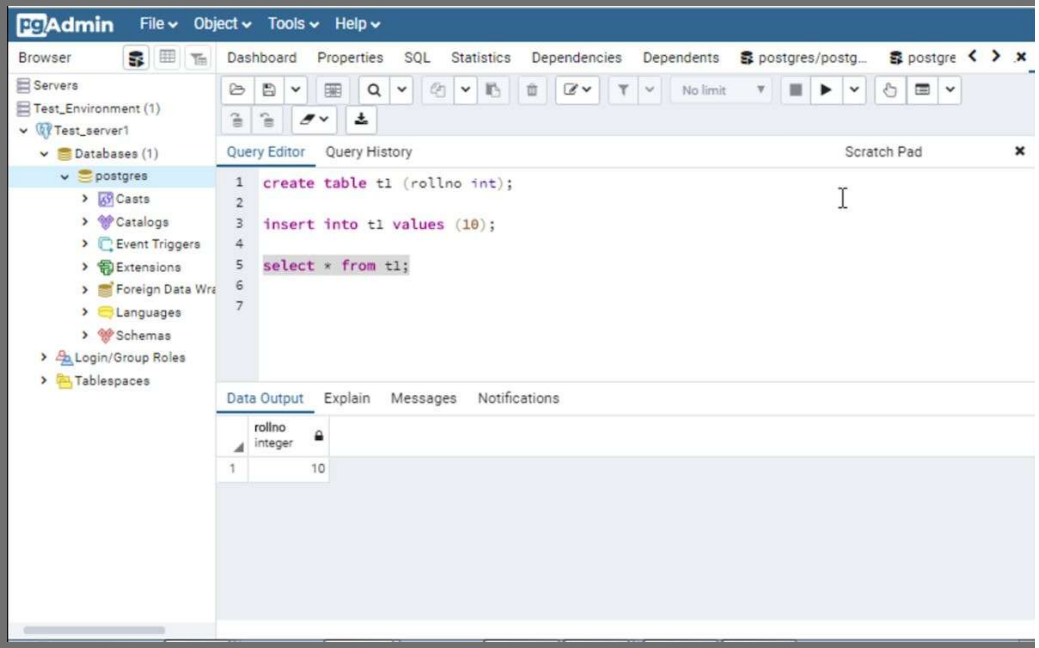

Other Database Models

- GIS
- Time-series
- BI (Business Intelligence)
- Key-value store
- Column store

Tools

- pgAdmin
- MongoDB Compass
- Neo4J Desktop

Practical Issues

- OLAP language MDX
- Live migration
- Realistic ETL
- Data warehouses
- Data lakes
- Cloud-based DBs
